

# Data Modelling Steps

- Loading the data
- Missing Value Percentages Evaluation
- Imputing the Missing Values
- Analyzing numerical and categorical features
- One hot Encoding Nominal Categorical Variables
- Label Encoding Ordinal Categorical Variables
- Scripting Linear Regression (Gradient Descent, Mini Batch Gradient Descent, Stochastic Gradient Descent)

# Numerical Variables Visualization

- All numerical variables follow normal distribution.
- Linear Regression assumption of normality is followed
- No zero variance features

# Categorical Variables Visualization

- Count Plot of ordinal and nominal categorical variables is shown after one hot and label encoding.
- No Zero Variance Features

# Gradient Descent Algorithm

- The plot of Mean Squared Error (J) vs iteration is shown.
- Learning Rate alpha is chosen as 0.0001 and 0.001  
Tolerance is chosen as 0.001
- If difference in the parameters w and b of successive iterations is less than or equal to the certain chosen tolerance then it means the algorithm has been converged.

```
Final Parameters:  
w: [ 2.23109925  4.69104841 17.06131288 -8.67815007 -9.21420189 -5.5342348  
10.19313628  9.68492843  4.12734093 -4.25064661  6.37652065 -5.45841308  
 3.16441603 -8.14019829  0.54369745 -3.82969563]  
b: [39.94520263]  
MSE: 222.15949865763417
```

Text(0, 0.5, 'MSE')

Alpha=0.001

```
Final Parameters:  
w: [ 9.41221699  3.47327526 11.62464216 -1.44152053 -8.98098144 -5.35639895  
10.34516989  9.941504  4.3496596 -4.1923832  9.25021432 -5.21778095  
 4.95330663 -8.11050933  0.51236999 -3.65651565]  
b: [19.36124178]  
MSE: 313.03965827039025
```

Alpha=0.0001

We can see that the algorithm when run with high learning rate show a steep decrease in MSE at first in contrast to slow and gradual decrease of MSE when low value of learning rate is chosen.

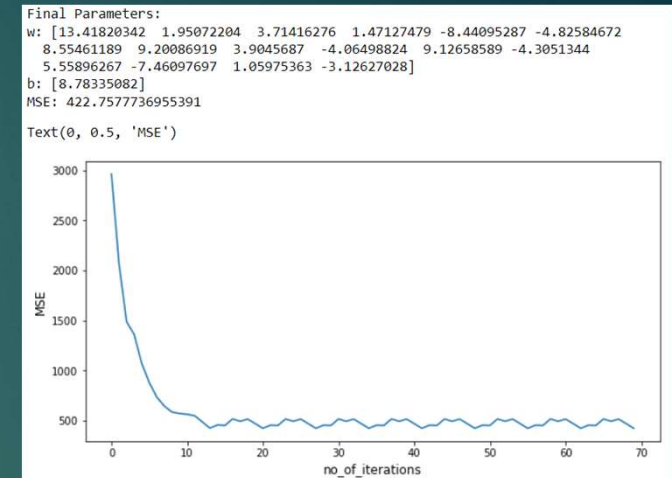

# Mini Batch Gradient Descent Algorithm

Batch Size=32

Batch Size=64

Batch Size=300

Parameters Chosen :

Alpha = 0.00001

Tolerance = 0.001

Epochs = 10

Number of Observations = 2000

Observation : Gradient Descent with smaller batch sizes are noisy. Also the smaller loss is associated with smaller batch size.

# Stochastic Gradient Descent Algorithm

Parameters Chosen :

Alpha = 0.00001

Tolerance = 0.001

Epochs = 1

Number of Observations = 2000

In Stochastic Gradient Descent parameter update takes at each training example. Its just a Mini Batch Gradient Descent where batch size equals to 1.

Observation :Stochastic Gradient Descent takes a very noisy path in its attempt to reach global minimum. In fact it may never reach global minimum but it will keep oscillating around the global minimum.

Final Parameters:

## L2 Regularization

With L2 Regularization we are just trying to reduce the model complexity by penalizing the parameters.

$$J = \sum_{i=1}^m (ypred - y)^2 \cdot \frac{1}{m}$$

*With Regularization*

$$J = \frac{1}{m} \cdot \left( \sum_{i=1}^m (ypred - y)^2 + lambda \cdot \sum_{j=1}^p ||\theta_j||^2 \right)$$

$$\frac{dJ}{d\theta_j} = \frac{1}{m} \left( \sum_{i=1}^m 2 \cdot (ypred - y) \cdot x_j^i + 2 \cdot lambda \cdot \theta_j \right)$$

*Parameters Update*

$$\theta_j := \theta_j - \alpha \cdot \frac{dJ}{d\theta_j}$$

*Putting the values we get*

$$\theta_j := \left( \theta_j - 2 \cdot \alpha \cdot \frac{lambda}{m} \right) - \frac{2}{m} \cdot \alpha \cdot \left( \sum_{i=1}^m (ypred - y) \cdot x_j^i \right)$$

$$ypred = \theta_0 + \theta_1 \cdot x_1 + \theta_2 \cdot x_2 + \dots + \theta_p \cdot x_p$$

*where  $m$  = Number of Observations,  $p$  = Number of Features*

*lambda = Regularisation Parameter and  $\alpha$  = Learning Rate*
